

Web Application Development Practical

Aim:

To create a user registration form using JavaScript and store data in Local Storage using AJAX POST method and display users on another page.

Folder Structure:

```
registration-app/  
■■■ index.html  
■■■ users.html  
■■■ script.js  
■■■ style.css
```

Step 1: Create index.html file.

Step 2: Create script.js file.

Step 3: Create users.html file.

Step 4: Create style.css file.

Step 5: Run index.html in browser.

index.html

```
<!DOCTYPE html>  
<html>  
  <head>  
    <title>User Registration</title>  
    <link rel="stylesheet" href="style.css">  
  </head>  
  <body>  
  
    <h2>User Registration Form</h2>  
  
    <form id="regForm">  
      <input type="text" id="name" placeholder="Enter Name" required><br><br>  
  
      <input type="email" id="email" placeholder="Enter Email" required><br><br>  
  
      <input type="password" id="password" placeholder="Enter Password" required><br><br>  
  
      <button type="submit">Register</button>  
    </form>  
  
    <br>  
  
    <a href="users.html">View Registered Users</a>  
  
    <script src="script.js"></script>  
  
  </body>  
</html>
```

script.js

```
document.getElementById("regForm").addEventListener("submit", function(e) {  
  e.preventDefault();  
  
  let name = document.getElementById("name").value;  
  let email = document.getElementById("email").value;  
  let password = document.getElementById("password").value;  
  let user = {
```

```

        name: name,
        email: email,
        password: password
    };

    let xhr = new XMLHttpRequest();
    xhr.open("POST", "https://jsonplaceholder.typicode.com/posts", true);
    xhr.setRequestHeader("Content-Type", "application/json");
    xhr.onload = function() {
        if (xhr.status == 201) {
            let users = JSON.parse(localStorage.getItem("users")) || [];
            users.push(user);
            localStorage.setItem("users", JSON.stringify(users));
            alert("Registration Successful");
        }
    };
    xhr.send(JSON.stringify(user));
});

```

users.html

```

<!DOCTYPE html>
<html>
<head>
    <title>Registered Users</title>
</head>
<body>

    <h2>Registered Users</h2>

    <table border="1" id="userTable">
        <tr>
            <th>Name</th>
            <th>Email</th>
            <th>Password</th>
        </tr>
    </table>

    <script>

        let users = JSON.parse(localStorage.getItem("users")) || [];
        let table = document.getElementById("userTable");
        users.forEach(function(user) {
            let row = table.insertRow();

            row.insertCell(0).innerHTML = user.name;
            row.insertCell(1).innerHTML = user.email;
            row.insertCell(2).innerHTML = user.password;
        });
    </script>

</body>
</html>

```

style.css

```
body {  
    font-family: Arial;  
    margin: 30px;  
}  
  
input {  
    padding: 8px;  
    width: 250px;  
}  
  
button {  
    padding: 10px;  
    background-color: blue;  
    color: white;  
    border: none;  
}
```

Result:

Successfully created a JavaScript registration application using AJAX POST method and Local Storage.

Viva Questions:

1. What is AJAX?

AJAX is used to send and receive data without reloading the page.

2. What is Local Storage?

Local Storage stores data permanently in browser.

3. What is POST Method?

POST method sends data to server securely.
