

Cloud Computing Practical - AWS Amplify

Practical: Use AWS Amplify (PaaS Environment) to launch a web application.

Aim: To deploy and host a web application using AWS Amplify cloud platform.

Requirements:

1. AWS Account
2. Internet Connection
3. HTML/CSS Project Files
4. ZIP file of the project

Step 1: Login to AWS Management Console.

Step 2: Search for 'AWS Amplify' in the AWS search bar.

Step 3: Open AWS Amplify service.

Step 4: Click on 'Deploy an App'.

Step 5: Select 'Deploy without Git provider'.

Step 6: Upload the ZIP file of your web application project.

Step 7: Enter App Name such as 'MyAmplifyApp'.

Step 8: Click on 'Save and Deploy'.

Step 9: AWS Amplify will automatically build and host the application.

Step 10: After deployment, click the generated domain link.

Step 11: The web application will open successfully in browser.

Sample index.html Code

```
<!DOCTYPE html>
<html>
<head>
  <title>AWS Amplify Deployment</title>
</head>

<body>

  <h1>Application Hosted Successfully</h1>
  <p>Welcome to AWS Amplify Hosting</p>

</body>
</html>
```

Explanation:

AWS Amplify is a Platform as a Service (PaaS) provided by Amazon Web Services. It helps developers deploy, host and manage web applications easily without configuring servers manually. Amplify provides automatic hosting, scaling and continuous deployment.

Result: The web application was successfully deployed using AWS Amplify cloud platform.
